

PEDIATRIC  
PREVENTATIVE  
CARDIOLOGY

# **Pediatric Preventive Cardiology**

**Margaret M. Samyn, MD FAAP, FACC**

**University of Florida**

**Clinical Associate Professor**

# Agenda

- Scope of the Problem
- Precursors for CAD in Childhood
- AHA Guidelines for Hyperlipidemia Tx

# The Scope of the Problem

# Cardiovascular Disease

*AHA 2002 Heart & Stroke Statistical Update,*  
Dallas, Texas

## 61.8 Million Americans with CV disease

- 50 Million – Hypertension
- 44.2 Million - Obesity
- 41.3 Million – Hypercholesterolemia
- 12.6 Million – Coronary heart disease
- 4.8 Million - CHF
- 4.6 Million – Stroke
  
- 1 Million – Congenital cardiovascular defects  
40,000 babies born with congenital heart disease

## Cardiovascular Disease The Leading Cause of Death for All Males & Females

# What is atherosclerosis?

- Affects medium & large arteries throughout the body.
- Inflammation and cellular & lipid (fat) accumulation within vessel walls, leads to eventual luminal narrowing (artery stenosis).
- Prevents good oxygenated blood delivery to tissues.
- While initially asymptomatic, symptoms progressively occur as luminal narrowing combines with acute thrombotic (clotting) events.

**Autopsy evidence: “Clogged arteries”  
begin in childhood as arteries w/ fatty streaks.**

# Role of LDL & HDL Cholesterol

## LDL

- Synthesizes cell membranes & steroid hormones
- Generates foam cells of early atherosclerosis
- \* 2/3 removed by liver; 1/3 by scavenger pathways

## HDL

- Involved in reverse cholesterol transport
- Acquires more cholesterol  
(esterified using Lecithin Chol. Acyl Transferase - LCAT)
- Exists as multiple subtypes (HDL 1 - 5)
- $> 60 =$  protective and  $< 40 =$  low

# Atherosclerosis: A Progressive Process

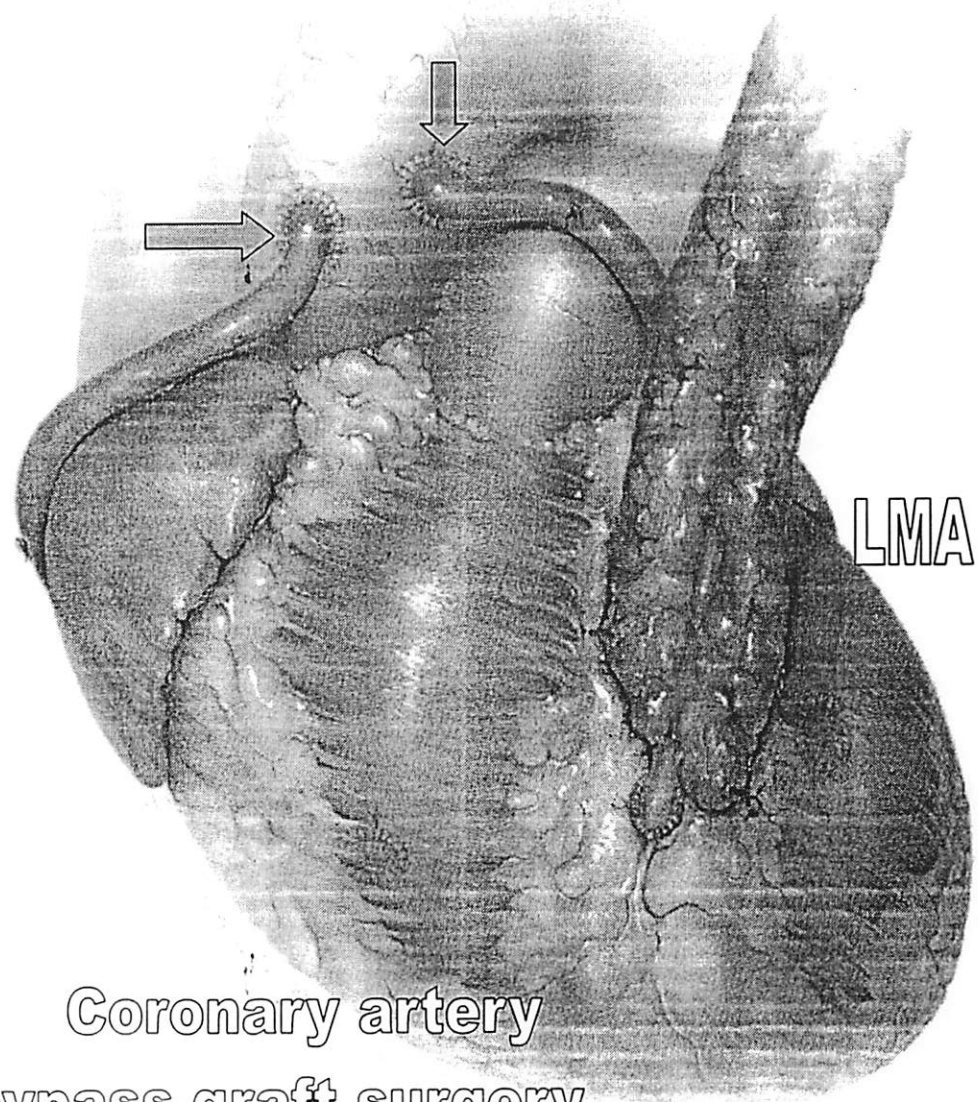

Courtesy of P. Ganz.

# Atherosclerosis

Coronary artery  
bypass graft surgery

LMA

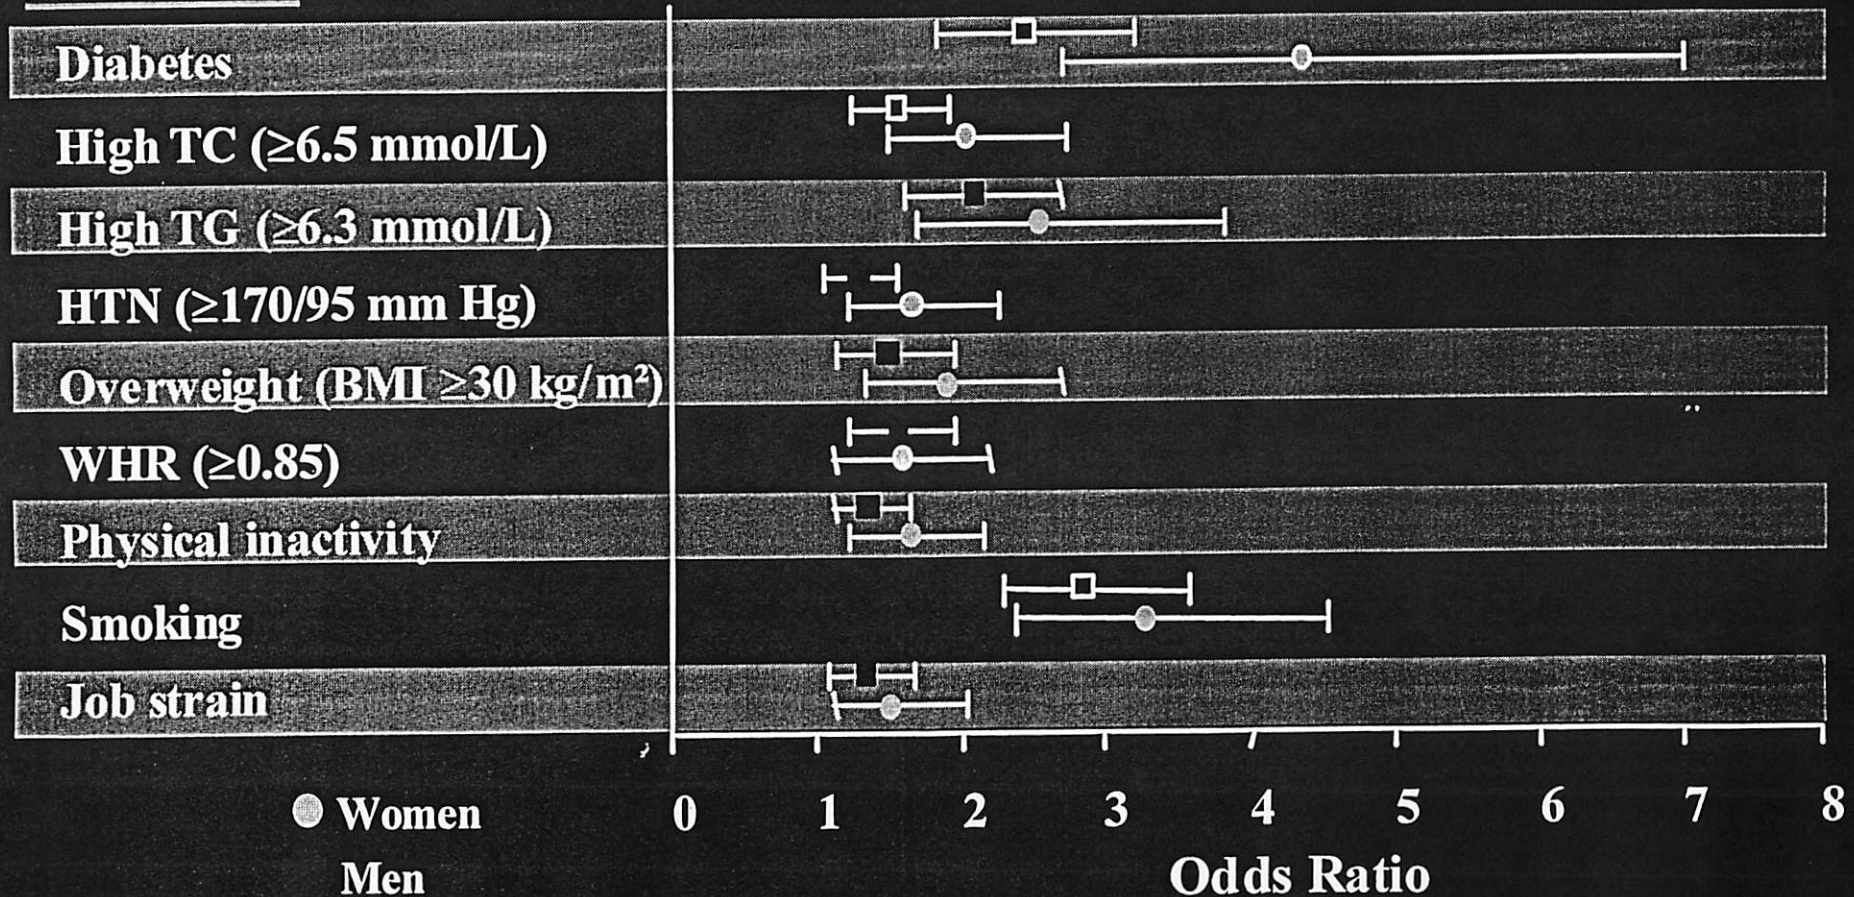

## Manifestations of Atherosclerosis

- **Coronary Artery Disease (CAD)**
  - Angina (chest pain of myocardial ischemia)
  - Myocardial Infarction (“Heart attack”)
- **Cerebral Vascular Disease (CVD)**
  - Transient Ischemic attacks (TIA)
  - Stroke
- **Peripheral vascular disease (PVD)**
  - Intermittant claudication
  - Rest pain (leading to limb loss)

# SHEEP: Risk Factors for Nonfatal MI in Men and Women

## Risk Factor

SHEEP=Stockholm Heart Epidemiology Program.

Reuterwall C et al. *J Intern Med.* 1999;246:161-174

# Risk Factors for CAD

- Lipids  $\uparrow$  LDL,  $\uparrow$  triglycerides, or  $\downarrow$  HDL
- HTN
- Diabetes
- Smoking
- Family History
- Age
- Obesity ( $> 95\%$  for wt)
- Physical inactivity

# Friedwald Formula

$$\text{LDL} = \text{Total cholesterol} - \text{HDL} - \text{TG}/5$$

\* Invalid if TG > 400 mg/dl

# Relative Risk of Coronary Heart Disease In 4 Years

**21 - 37% of patients with CHD have isolated low HDL**

# The Muscatine Heart Studies: Coronary Calcification Study

## Study Design:

- Biennial School Surveys conducted in Muscatine Iowa from 1971 - 1981 (children age 8 to 18 yrs)
- 197 men & 187 women had CV risk factors measured in childhood ( $\cong$  15yo) & 2x as adults with CT @ 2nd visit

## Results:

- Prevalence of coronary artery calcifications:  
31% in men                      10% in women

## Conclusions:

- $\uparrow$ BMI,  $\uparrow$  BP, &  $\downarrow$  HDL strongest association with coronary calcification (known biomarker of CAD)

# The Muscatine Heart Studies

## Intimal Medial Thickness

### Study Design:

- 182 men (M) & 136 women (W) (age 33 - 42), returned to U of Iowa for carotid Duplex US
- Determine mean of 12 measurements of maximal IMT & compare to Coronary Artery Calcification (CAC)

### Results:

- CAC existed: 27% M & 14% W
- IMT ave: 0.788 mm(SD 0.127) M & 0.720(SD 0.105) W

### Conclusions:

- CAC was significantly associated with ↑ IMT
- Risk factors for ↑ IMT:  
↑ LDL & smoking (M) & ↑ LDL & ↑ systolic BP (W)

# The Bogalusa Heart Study

## Study Design:

- Long term epidemiologic study of CV risk factors in Louisiana population (age 2 - 39 yo; begun in '70s)
- Autopsy Study (93/204) with autopsy & survey data
- re: ante mortum CV risk factors

## Conclusions:

- Extent of aorta & coronary artery with fatty streaks & fibrous plaques ↑ significantly with age in people dying of non cardiac causes.
- ↑ BMI, total cholesterol, LDL & TG and ↓ HDL *strongly* associated with lesions.

# Biomarkers for CAD Assessment

- CPK MB & troponins:  
↑ BL levels correspond with ↑ mortality at 30 days
- CRP: Correlation between inflammation & atherosclerosis  
0.05 mg/ dL normal & > 0.21 3x ↑ MI Risk
- Lp<sub>a</sub>: ↑ level means ↑ risk of ischemic heart dz.
- Fibrinogen: ↑ level ↑ death from premature CAD
- Homocysteine: > 15.8 nM/dL, then 3 x ↑ risk of MI

*This is an area of active pre clinical & clinical research.*

# AHA Guidelines for Cardiovascular Health Promotion for All Children and Adolescents

- Diet
  - Address overall healthy eating pattern
  - Attain appropriate weight
  - Attain appropriate lipid profile
  - Attain appropriate blood pressure
  
- Physical Activity
  - Be physically active *every* day
    - at least 60 min/ day moderate to vigorous aerobic activity; for teens may add resistive training
  - Reduce sedentary time
    - television, computer, video games, telephone time should be no more than 2 hours/ day
  
- Smoking
  - No new initiation of cigarette smoking
  - No exposure to environmental smoke
  - Complete cessation for those who smoke

# AHA Guidelines for Identification of Children and Adolescents at High Risk of CVD

## General assessment:

- Family History
- Education: risk factors

## \* Specific Risk Assessment:

### Level of Concern

- Lipids
- Blood pressure
- Body Size

# Pediatric Lipid Guidelines

*HDL <35 and TG > 150 are concerning.*

|            | Total      | LDL        |
|------------|------------|------------|
| Desired    | < 170      | < 110      |
| Borderline | 170 - 199  | 110 - 129  |
| High       | $\geq$ 200 | $\geq$ 130 |

# Risk Assessment: Who do you screen?

- Children whose parents/grandparents have:
  - premature CAD ( $\leq 55$  years) by angiography
  - premature event: MI, angina, sudden cardiac death, cerebral vascular dz, or PVD
- Children whose parent with total cholesterol  $\geq 240$
- Children whose family history is not known & who may have other risk factors for CAD

\* *Children should be over 2 years of age for screening.*

# Initial Cholesterol Screening in Local Pediatrician's Office

Child's CAD  
Risk Assessment

Parental  
High Cholesterol  
>240

Positive Family History

Measure Total Cholesterol  
(Acceptable <170 . . . ck in 5yrs  
Borderline 170 - 199 . . . repeat  
High > 200 . . . do lipoprotein analysis)

Do lipoprotein analysis  
Fasting profile (Total chol, HDL, TG, & LDL)

Refer to PPCC  
if fasting profile  
remains abnormal

# Initial Work Up Labs

- Fasting cholesterol profile
- Electrolytes including calcium
- BUN/ Cr
- Fasting glucose
- UA
- Total Protein & Albumin\*
- LFTs\*
- TSH/ Free T4\*

# Secondary Causes of Hypercholesterolemia

**Hypothyroidism**  
**Nephrotic syndrome**  
**Chronic liver disease**  
**Dysglobulinemia**  
**Cushing's syndrome**  
**Hyperparathyroidism**  
**Acute intermittent  
porphyria**

# Secondary Causes of Hypertriglyceridemia

**\*Non fasting profile**

**\*Obesity**

**Alcoholism**

**DM**

**Estrogen Use**

**CRF**

**Cushing's syndrome**

**Glucocorticoid use**

**B Blocker use**

**Diuretic use**

**Hypopituitarism**

**Hypothyroidism**

**Pancreatitis**

**Dysglobulinemia**

**Glycogen storage dz**

**Lipodystrophy**

**Pregnancy**

**Stress**

**Uremia**

**Acute intermittant porphyria**

# Pediatric Preventative Cardiology Clinic Work up of Hyperlipidemia

Do Lipoprotein Analysis  
10 -12 hour fast

Acceptable LDL  
<110  
Repeat & Average  
<110

Borderline LDL  
110 -129  
Repeat & Average  
110 -129

High LDL  
>130  
Repeat & Average  
>130

Repeat Analysis in 5 years  
Provide education on  
recommended diet  
& risk factor reduction

Risk factor advice  
Step One Diet  
Reevaluate in 1 year

Clinical evaluation  
(H&P, labs to r/o secondary causes)  
Screen all family members

1st return in 6 - 12 weeks\*  
with 2nd return visit in 12 weeks\*\*

# American Heart Association Diets

\* No restriction of fat or cholesterol if <2years old.  
(Advance to Step Two if no significant results in 3 months)

Step One  
Diet

Total Fat  
 $\leq 30\%$

Sat Fat  
8 – 10 %  
(<10% poly  
unsat fats)

Cholesterol  
< 300 mg/dL

Step Two  
Diet

Total Fat  
 $\leq 30\%$

Sat Fat  
< 7%  
(<10% poly  
unsat fats)

Cholesterol  
< 200 mg/dL

# Actual Fat Intake by US Children

- 35% calories from fat
- 14% sat. fat
- 193 - 296 mg/ day of cholesterol

US Dept of Agriculture 1987-88

- 34% calories from fat
- 12% sat fat
- 270 mg/day of cholesterol

Nat'l Health & Nutrition Exam 1994

# When should drug therapy be considered?

Goal: LDL < 160 mg/dL (< 130 better)

For diabetics, LDL < 100 mg/dL

- Children > 10 years old
- After 6 - 12 mo of diet/exercise tx
- LDL cholesterol remaining  $\geq$  190
- LDL cholesterol  $\geq$  160 plus:
  1. Positive family hx (<55 CAD)

or

2. Child has 2 risk factors for CAD

## Goal for other Lipids

- Fasting TG  $\leq$  150 mg/dL
- HDL  $>$  35 mg/dL
  
- Interventions typically involve lifestyle changes
  - increase aerobic activities
  - decrease intake of simple sugars (e.g. soda pop & sweets)
  - no pharmacologic intervention unless TG  $>$  400 \*

*(\*Look for secondary causes)*

# Key Lipid Lowering Drugs for Children

1. Bile Acid Sequestrants\*

2. Nicotinic Acid

3. Fibric Acid Derivatives

4. HMG Reductase Inhibitors (Statins)\*

# Bile Acid Sequestrants

- Used if young patient
- Used if low risk for CAD

## Contraindicated if:

1. Elevated TG exists

2. Using certain drugs:

digoxin, warfarin, thyroxine, thiazides, B blockers  
(decreases their absorption)

3. \* Take care to give vitamins

# Nicotinic Acid

- Recommended for Tx elevated TG
- ASA 30 min prior - decreases side effects
- Side effects:
  1. Flushing
  2. Potentiates anti HTN drugs
- Exercise caution with:
  1. Diabetics
  2. Statins - hepatitis & myopathy ↑↑
- Special formulation:

Niaspan (KOS) slow-release niacin

## Fibric Acid

- Treatment for increased TG
- GI side effects
- Potentiates oral anticoagulants
- May cause myopathy if given with a statin

# HMG Reductase Inhibitors (Statins)

CARDIOVASCULAR DRUGS  
in the Pipeline  
and approved

- Block HMG CoA step in the acetylation of cholesterol to cholesterol esters
- Includes: atorvastatin, simvastatin, etc.
- \*Liver functions studies be checked @ baseline, 6wks, and then q 6 mo.
- \*Effective means of birth control essential
- \*Transient myalgias

# HDL-C :

## What's available

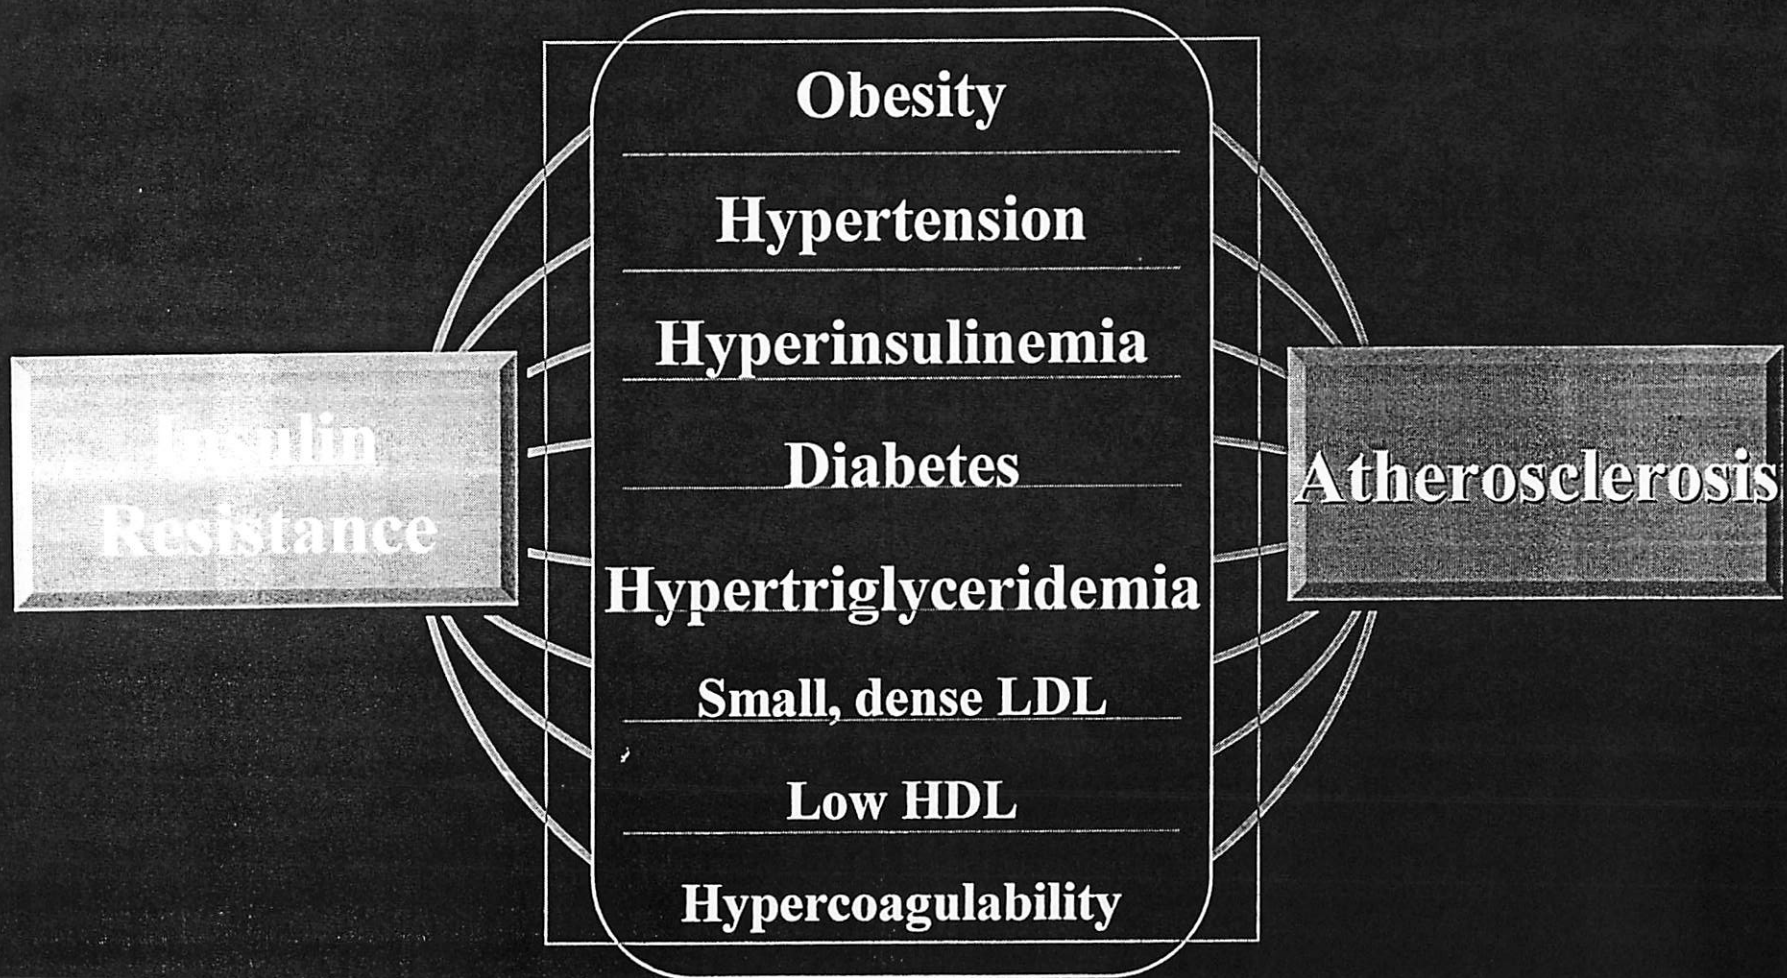

- Sequestrants - 3-5%
- Nicotinic acid (niacin) - 15-35%
- Fibrates - 10-15%
- Statins - 5-15%

Exercise can raise HDL in the pediatric population.

# Metabolic Syndrome: Precursors Seen in Childhood

(JAMA Jan. 16, 2002)

# Definition of Obesity

AHA Scientific Statement. *Circulation* 106 (1): 143, 2002

American Heart Association broad definition:

“ . . . a level of being overweight that is associated with adverse physical or psychological health problems.”

# Traditional vs. "New"

## Shape of Weight-for-Stature Curve versus BMI-for-Age Curve

# Body Mass Index (BMI)

- Recommended for clinical assessment
- Calculated as:  $\text{weight (in kg)} / \text{height (in m)}^2$
- CDC published age & sex specific BMI norms
- Physicians calculate BMI if child has height or weight  $> 75\%$  for age & sex
- Crossing BMI percentiles = risk for obesity

\*Adults: Overweight if BMI 25 – 29. Obese if  $> 30$ .

\*\*Children/teens: “At risk,” if @ 85<sup>th</sup> to 94<sup>th</sup> BMI percentile & if  $> 95\%$ , obese.

# Causes of Obesity

- Complex interplay of genetics & environment exists.

65 – 80% heritability of body fat distribution & height.

- *Occasionally* secondary causes\* exist like:

Hypothyroidism

Prader Willi Syndrome

Cushing Disease\*

*\*Usually such syndromes involves poor growth in height too & distinct phenotypes (physical characteristics).*

## Co – morbidities Associated with Childhood Obesity <sup>(1)</sup>

- Cardiovascular\*:

Hypertension (High BP)

Lipid disorders

( ↑ total chol, LDL or triglycerides, ↓ HDL)

Premature atherosclerosis

- Respiratory :

Poor ventilation (occasionally apnea)

Pickwickian syndrome

## Co – morbidities Associated with Childhood Obesity (2)

- Orthopedic:

Slipped capital femoral epiphysis\*

Blount's Disease (affects tibia)

Legg – Calve - Perthes Disease

# Co – morbidities Associated with Childhood Obesity (3)

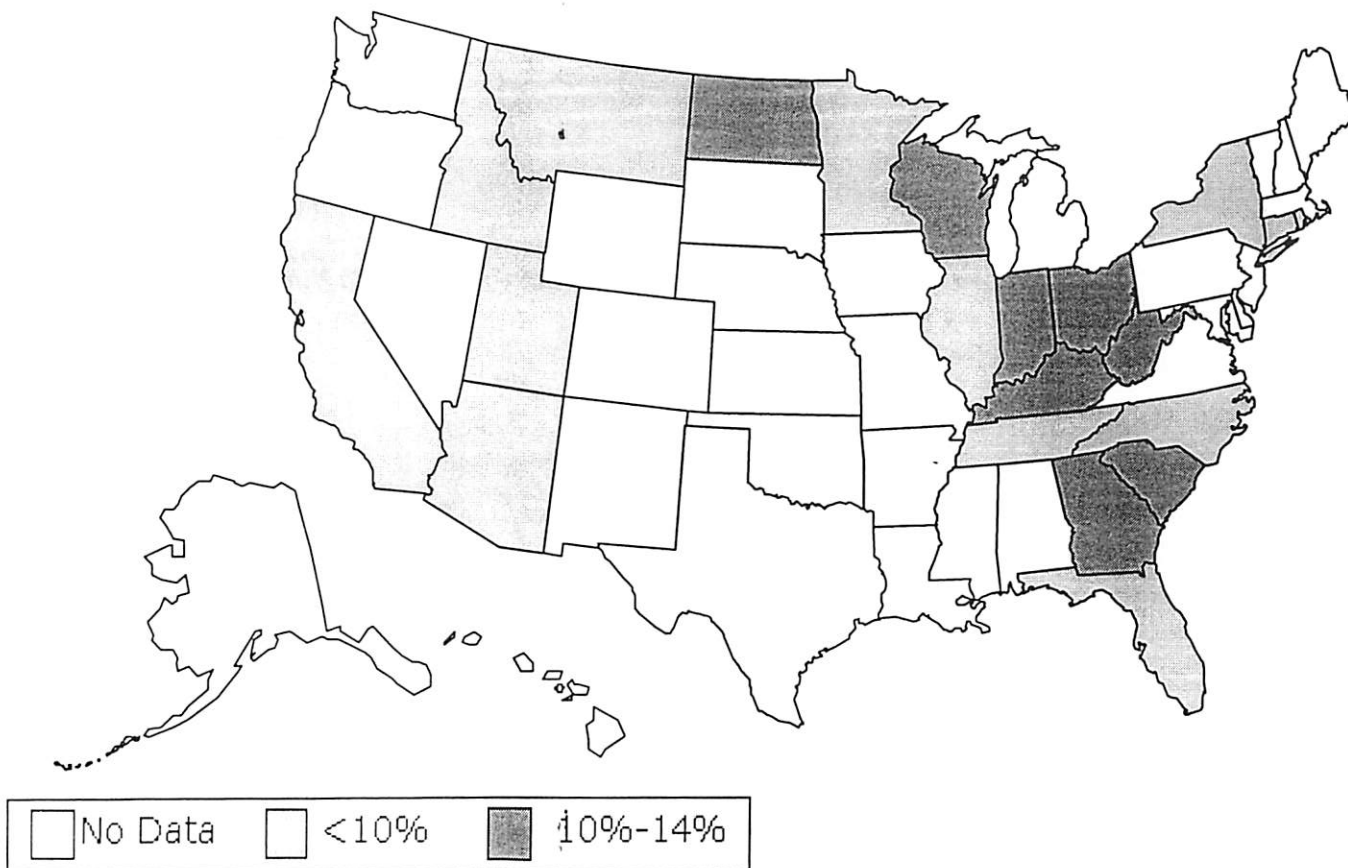

- Endocrinologic:
  - Glucose intolerance (pre diabetic state)
  - Type II Diabetes
  - Dysmenorrhea
  - Polycystic Ovary Disease
- Psychiatric:
  - Depression
  - Bulemia nervosa
- Dermatologic:
  - Furunculosis
  - Acanthosis Nigricans

# Obesity Trends\* Among U.S. Adults in 1985

(\*BMI  $\geq 30$ , or  $\sim 30$  lbs overweight for 5'4" woman)

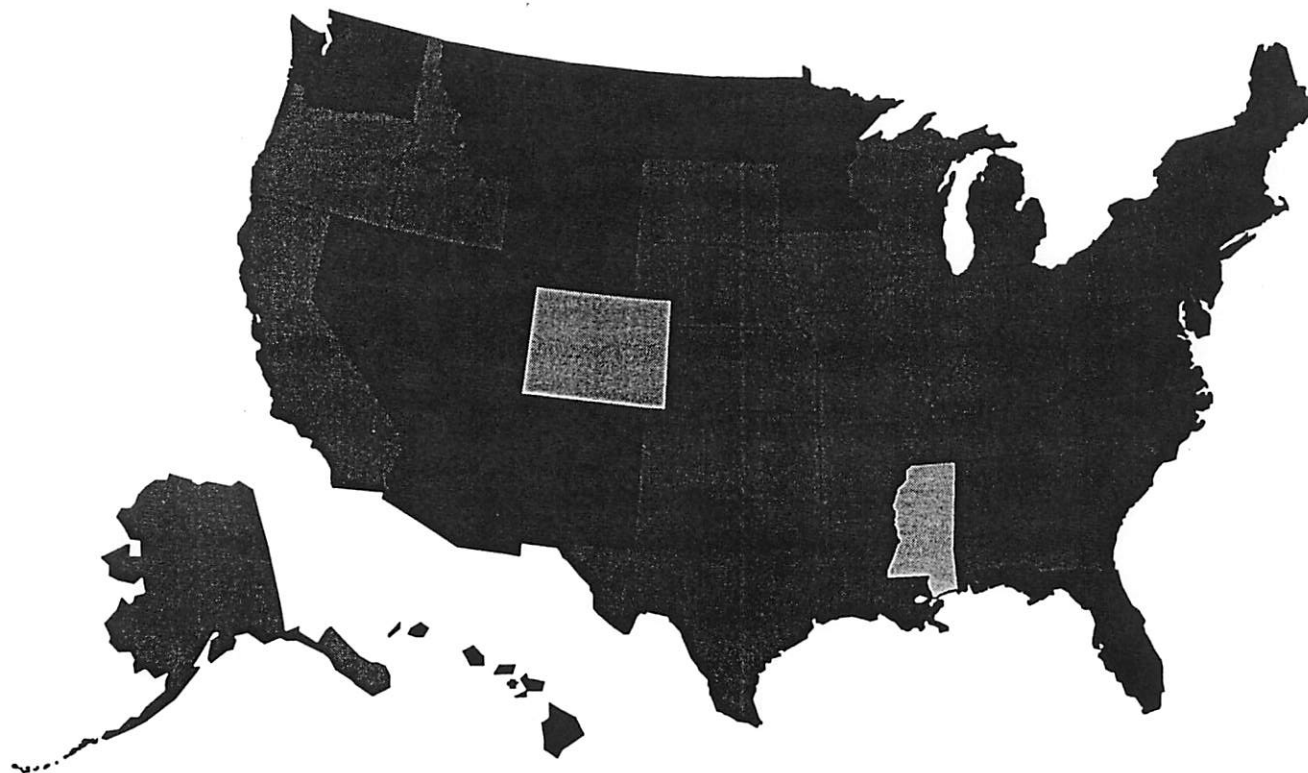

Source: Mokdad A H, et al. *J Am Med Assoc* 1999;282:16, 2001;286:10.

# Obesity Trends\*

## Among U.S. Adults in 2001

(\*BMI  $\geq 30$ , or  $\sim 30$  lbs overweight for 5'4" woman)

Source: Mokdad A H, et al. *J Am Med Assoc* 1999;282:16, 2001;286:10.

# National Pediatric Statistics

[www.CDC.gov](http://www.CDC.gov)

- 70 Million (2000):  
US infant, children, teen population
- Overweight (1999 – 2000):  
10% age 2 – 5y  
15% (~ 9 M) age 6 – 15y\*  
*\*triple the proportion in 1980*
- ↑ chol. (> 200 mg/dL):  
10% (7 M) of 12 – 19 y.o
- High BP: *Add Stats*

## Strong Correlation Between Obesity & Hypertension

- Rosner et. al.:  
Pooled data 8 large US epidemiological studies  
(N = 47,000 children).

Irrespective of race, gender, or age,  
the risk of having  $\uparrow$  BP was significantly higher for  
kids in upper deciles of BMI than in lower deciles.

- Bogalusa Heart Study:  
Odds ratio 4.5 for developing systolic HTN &  
2.4 for diastolic HTN, if youngster overweight.

# Consequences of Hypertension: End Organ Damage

- Heart:
  - Accelerated CAD (e.g. chest pain or heart attack)
  - Cardiac hypertrophy (wall thickening)
  - Heart failure
- Kidneys
  - Renal dysfunction or failure
- Eyes
- Brain
  - Decreased cognitive function with aging
  - Stroke

## Comprehensive Therapy for Obese Patients

- Ultimate Goal: ↓↓ morbidity & mortality.
- Focus on “heart healthy” lifestyle.
- Protect youngster’s self esteem.
- Do not focus on achieving “cosmetic body.”

## Multidisciplinary Team Approach

- Members: Family\*, pediatrician, sub specialist (endocrinologist or cardiologist), dietician, exercise physiologist, & sometimes a mental health professional.
- Address cardiac risk factors (BP, lipids, etc.).
- Set specific goals: exercise & food choices
- Follow up frequently with *trusted* care giver.

\* *Schools could play a role.*

## Monitor Blood Pressure (BP)

- E.g. 100/70 systolic/ diastolic BP
- American Heart Association charts give normal BP for males & females, listed by age & height %.
- Measuring BP is part of the normal physical exam.
- Refer to specialist, if elevated BP 3 visits, when taken with proper size BP cuff, while child *relaxed*.

# Regular Pediatric Aerobic Physical Activity

\*Goldberg & Samyn. A method for preventive cardiology in children.  
*Progress in Pediatric Cardiology* 12 (2001)155 –160.

- Fun & entertaining
- “Healthy:”

Enhances weight loss  
↓ blood pressure  
↓ atherosclerotic risk\*  
Raises HDL  
↓ LDL

- Sets pattern, creating “habit” for adult life.

# More Intensive Therapies

- Weight reduction:
  - Enrollment in Weight Watchers (teens)
  - Summer camp for weight reduction
  - Hospitalization for weight reduction
  - Gastric bypass surgery (rare)
- BP Control & Lipid Therapy
  - If exercise does not successful after ~ 6mo, consider anti HTN and cholesterol lowering medications\*.

(\*usually child over 10 y.o. for cholesterol lowering meds).
